

# Vilde and Julies table

Emission:

## 150 kg of CO<sub>2</sub>eq

### Comments on the result

The climate bar shows how the emissions from the design are distributed between 10 sources within the product life cycle. Here you can see that the biggest impact comes from the materials, in this case the aluminum base. However, the design for disassembly allows for the recycling of the metal parts, hence a credit is given. This is illustrated by the part of the climate bar that lies below zero.

### Disclaimers:

We assume that metals, plastics and textiles are produced according to the global average unless we know differently.

All other materials are assumed to be produced in the EU

We assume a transport distance by lorry from supplier to warehouse of 1,000 km

We assume a transport distance from warehouse to final client of 1,000 km

Målbar builds their assumptions on their experience with industrial production and LCAs on manufacturing companies.
